TITLE : TICKET FOR PASSAGE

ABSTRACT : **PURPOSE:** To check a ticket for passage and update data, by providing a controlling part, an IC memory, a transmitting part, and a receiving part to input command and information from the external without contacting and performing processings such as operation and storage internally on a basis of these information.

CONSTITUTION: A receiving part 4 to which commands and information from the external are inputted without contacting is provided, and input data is amplified by an amplifier 5 and has the carrier wave removed by a demodulating circuit 6 to output encoded receiving data, and this data is inputted to a controlling part 8 through an interface 7. In this controlling part 8, the interpretation of receiving data, the operation of a memory 13, the control display of a display part 14, the generation of transmission data, etc. are performed. In case of the transmission of transmission data from the controlling part 8 to an external card, transmission data is applied to a modulating circuit 10 through a buffer 9 and is FM-modulated in a modulating circuit 10, and modulated data is transmitted from a transmitting part 12 through a driver 11. In a card processing device, processings such as operation and storage are performed to check a ticket for a passage and to update data.
